## ALIGNMENTS

```
Pure or recombinant chemokine CKDLR201.1 - useful, e.g. for treating PT Pure or recombinant chemokine CKDLR201.1 - useful, e.g. for treating FT inflammation and as antiviral agents

Caim 7; Page 61-64; 77pp; English.

Cr he present sequence encodes mouse G-protein coupled receptor 69A08 #1

protein which comprises a plurality of epitopes. Host cells containing vectors comprising a nuclectide sequence encoding the protein are used to protein treatment of a cell, particularly neuron, comprophage or lymphocyte, carrying a G-protein coupled receptor (GPCR)

Cr a receptor responsive to CKDLR201.1 chemokine protein, with an carrophage or lymphocyte, carrying a G-protein coupled receptor (GPCR)

Cr a receptor responsive to CKDLR201.1 chemokine protein, with an captain of calcium ion fulux, a chemoattractent response, morphology, phosphoinositide lipid turnover or an antiviral response, morphology, categories to calculus a primers or probes, e.g. for detecting and isolating related sequences and for expressing antigenic peptides. Antibodies (Ab) directed against the coupled and GPCRs are used to detect or purify the proteins; contential drugs; to inhibit chemokine/receptor activation; (when coupled contial drugs; to inhibit chemokine/receptor activation; (when can be used to treat inflammation, e.g. asthma; as antiviral agents, and to treat abnormal cell proliferation, regeneration, regeneration and atrophy. Therapeutic agents are administered orally, by cinjection and rectally.

Inflammation and as antiviral agents

Claim 7: Page 66-68; 77pp; English.

Corporation which comprises a plurality of epitopes. Host cells containing vectors comprising a nucleotide sequence encoding the protein are used to produce recombinant protein. Treatment of a cell, particularly neuron, macrophage or lymphocyte, carrying a G-protein coupled receptor (GPCR)

Car receptor responsive to CKDLR201.1 chemokine protein, with an carcophage or lymphocyte, carrying a G-protein coupled receptor (GPCR)

Car receptor responsive to CKDLR201.1 chemokine protein, with an alteration of calcium ion influx, a chemoattractant response, morphology, phosphoinositide lipid turnover or an antiviral response, Nucleotide sequences the CKDLR201.1 protein, or GPCRs, are useful as primers or probes, e.g. for detecting and isolating related sequences and for expressing antigenic peptides. Antibodies (Ab) directed against the CKDLR201.1 protein and GPCRs are used to detect or purify the proteins; diagnostically (e.g. for developmental abnormalities); in screening for potential drugs; to inhibit chemokine/receptor activation; (when coupled to a toxin or radioisotope) for killing specific cells, and to raise antiviral agents, and to treat abnormal cell proliferation, regeneration, degeneration and attophy. Therapeutic agents are administered orally, by the control or and the control or control o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                4

A new gene, MEFV, associated with Mediterranean Familial Fever

A new gene, MEFV, associated with Mediterranean Familial Mediterranean

C I he present sequence represents a novel genomic nucleic acid sequence

(MEFV) encoding the protein pyrin associated with Familial Mediterranean

Fever (FMF). Host cells transformed with a vector comprising a nucleic

C acid encoding pyrin or its FMF-associated mutant, operably linked to a functional promoter, are used for the recombinant expression of the protein. The invention provides a method for diagnosing risk of FMF that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /cons_splice (5'site= Yes, 3' site=No)

comprises analyzing a patient sample for an amino acid or nucleic acid sequence of pyth; and (b) correlating detection of a mutated sequence with risk of developing FMF; Diagnostic Kits developed in this invention are used to identify and treat individuals at risk from FMF, a hereditary disease prevalent in persons having a non-Ashkenazi Jewish, Armenian, Arab, or Turkish background. Prior art FMF treatment with colchicine is not effective in patients who are colchicine-resistant, and this invention will cover all individuals.

Nuclectide molecule - comprises Myotonic Dystrophy locus of chromosome 19013, for diagnosis of disease status or risk chromosome 19013, for diagnosis of disease status or risk bisclosure; Figure 7; SBPP; English.

Myotonic Dystrophy is an inherited disease and is an autosomal dominant disorder. It shows a marked variability in expression canging from a severe congenital form which is frequently fatal to an asymptomatic condition associated with mormal longevity.

An increase in the severity of the disease in successive generations has been noted. The Myotonic Dystrophy gene (DM) encodes a protein with putative serine-thronine protein Kinase activity in normal individuals. The increase in the severity of the disease in the number of succesive generations is related to an increase in the number of constitute a normal gene whereas repeats in excess of 40, especially in excess of 50, constitute a mutant gene. The detection and constitute a normal gene mutant gene. The detection and to provide information as to an individuals likelihood of developing Myotonic Dystrophy. The sequence contains deletion polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1574 AIGGAICACTIGAGCCCAGGAGITCAACACCAGCCTGAGCAACAIGGTAAAACCCCAICT 1633

P. Modulating apoptosis by controlling the Survivin gene - useful for modulating apoptosis by controlling the disorders and tumours treating transplant rejection, degenerative disorders and tumours bisclosure; Fig 10; 108pp; English.

The survivin gene can be used to control apoptosis through modification of the gene. Survivin peptides can be used to inhibit cellular apoptosis, e.g. for enhancing the viability of organs and tissues prior to their transplantation, for preserving the growth of cells in culture or for treating conditions involving abnormal apoptosis,

C. for treating conditions involving abnormal apoptosis,

C. for infection, dermaclogical effects of ageing, disorders and diseases cuch as immunosuppression, gastrointestinal perturbations, cardiovascular disorders, apoptosis related to reperfusion damage, rejection of tissue crivity can be used to treat e.g. tumours.

Mutations in this gene (e.g. transitions, transversions, deletions and/or insertions) are associated with adult-onset polycystic Kidney disease (APKD). The PKD1 locus is GC-rich (62.4%). Comparison of this sequence with a previously reported partial CDNA sequence revealed differences at three

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        7017
                                                                                                                                                                                                                                       7787 CTCACACCTGTAATCCCAGCACTTTGGGAGGCCGAGGCAAGCAGATCACCTAAGGCCAAG 7728
locations (see features table). The most significant difference is the presence of two additional cytosine residues on the plus-strand at position 4566 of the previously reported sequence. The insertion results in a frame-shift in the predicted protein coding sequence, leading to replacement of 92 C-terminal amino acids with a novel 12 amino acid C-terminus. The PKDI gene contains 23 Alu repeats. There is a region consisting of 17 tandem copies of a perfect 27 bp repeat and two large CT-rich regions. 17681 C; 15785 G; 11616 T;

4 Wanner polycystic kidney disease gene, PKD1 - useful to treat and diagnose human autosomal or adult onset polycystic kidney disease.

5 Example 5; Pages 60-089; 25/Pp; English.

7 The present sequence is the human polycystic kidney disease.

7 The PKD1 place or polypeptide may be used to treat autosomal arkers ATPL (ATPEC) and DISS84.

7 The PKD1 gene or polypeptide may be used to treat autosomal and mutant polycystic kidney disease (APKD), and identify carriers of mutant PKD1 genes.

8 The present sequences autosomal and mutant PKD1 sequences can be perform subcellular and histochemical localisation studies, and to block the function of PKD1. Ab are also useful in rational drug antisense sequences derived from the PKD1 gene may used for detection and therapy.

          diagnose human autosomal or adult onset polycystic kidney disease
Claim 2; Pages 90-118; 257pp; English.
The present sequence is the human polycystic kidney disease in the human polycystic kidney disease in (PKDI) gene. The PKDI gene or polypeptide may be used to treat autosomal dominant polycystic kidney disease (APKD), and identify carriers of mutant PKDI genes, i.e. subjects susceptible to APKD.
C Antibodies (Ab) that distinguish between normal and mutant PKDI sequences can also be used in diagnostic tests. Anti-PKDI Ab may also be used to perform subcellular and histochemical localisation studies, and to block the function of PKDI. Ab are also useful in rational drug design studies to identify and test inhibitors of PKDI. Sense and antisense sequences derived from the PKDI gene may used for detection and therapy.
                                                                                                                                                                                                                                                                                                                                                                        CTCACACCTGTAATCCCAGCACTTTGGGAGGCCGAGGCAAGCAGATCACCTAAGGCCAAG 7728

Disclosure; Fig 5; 48pp; English.

This sequence encodes human lecithin-cholesterol acyltransferase (LCAT), which catalyses the transfer of fatty acid from the sn2 position of lecithin to the free hydroxyl group of cholesterol. Although the sequence is known (McLean et al (1986), Nucleic Acids Research 14, pages 9397-9406), a new use has been discovered for this enzyme.

Attheroscelerosis is a pathological condition of mammals characterised by the accumulation of cholesterol in the arteries, which leads to heart disease, strokes, heart attacks and peripheral vascular disease. The clasme is used in a novel method of treating atherosclerosis, which then causes a decrease in the accumulation of cholesterol. The method and the products can be used for the prophylaxis and treatment of atherosclerosis, and associated heart disease, myocardial infarction, stroke and peripheral vascular disease, as well as individuals suffering from Fish Eye Syndrome (caused by LCAT deficiency) or classic LCAT Deficiency Syndrome.

Turner's syndrome

Claim 19; Pages 51-67; 84pp; English.

Claim 19; Pages 51-67; 84pp; English.

Craylon corresponding to short stature has been identified as a region. The gene region corresponding to short stature has been identified as a region of approximately 500 kb in the PARI region of the x and Y chromosomes. Three genes in this region have been identified as candidates for the short cature gene. These genes were designated SHOX (also referred to as SHOX3) or HOX93), pET92 and SHOX (SHOX-11ke homeobox gene on chromosome three in this story and SHOX pene has two separate splicing sites resulting in two variations SHOXa and SHOXA the specification provides sequences of SHOX (short stature homeobox-containing) genes SHOX ET92, SHOXA, SHOXD condensors of the SHOX genes as shown in V35610 to V35621 and protein sequences of the human growth protein transcription factor SHOXA, SHOXD condensors of the human growth protein transcription factor SHOXA, SHOXD condensors of the human growth protein transcription factor SHOXA, SHOXD condensors in the products can cause short stature, e.g. for the treatment of short stature or other human growth disorders. The products can also be used for providing a mitogenic effect on cells, e.g. for the crament of short stature or other human growth disorders. The products can also be used for providing a mitogenic effect on cells, e.g. for the crament of short stature or other human growth disorders. The product can also be used for providing a mitogenic effect on cells, e.g. for the crament of short stature or other human growth disorders. The product can also be used for providing a mitogenic effect on cells, e.g. for the crament of shore diseases such as osteoporosis and diseases involved with disturbance in the bone calculum regulation.

This is a preliminary nucleotide sequence of the SHOX gene. The gene region corresponding to short stature has been identified as a region of exproximately 500 kb in the PRRI region of the X and Y chromosomes. Three genes in this region have been identified as candidates for the short stature gene. These genes were designated SHOX (also referred to as SHOX39 or HOX39), pET92 and SHOY (SHOX-like homeobox gene on chromosome three). The SHOX gene has two separate splicing sites resulting in two variations SHOXa and SHOXb. The specification provides sequences of SHOX cand exons of the SHOX genes as shown in v35610 to V35621 and protein sequences of the human growth protein transcription factor SHOXa, SHOXb and SHOX as shown W60573 to W60575. The novel genes are responsible for human growth. Defects in the genes can cause short stature, e.g.

Turner's syndrome. The products can be used to develop agents for the treatment of short stature or other human growth disorders. The products can also be used for providing a mitogenic effect on cells, e.g. for the treatment of bone diseases such as osteoporosis and diseases involved with disturbance in the bone calcium regulation.

Claim 1; Page 122-124; 195pp; English.

The human RAD50 (hRAD50) is involved in DNA repair and has tumour suppression activity, can be used to detect predisposition to, decrease the risk of or treat cancers, e.g. acute myeloid leukaemia, myelodysplastic syndrome, therapy related myeloid soldsplastic syndrome, therapy related acute myeloid leukaemia, refractory anaemia or refractory anaemia with excess blasts. Also disclosed in this invention is Human Septin-2 homologues of which may be used as targets for cancer theraples and central nervous system directed treatment methods, and to measure the proliferative potential of selected cell types.

New acute lymphocytic leukaemia gene prods. - used for the diagnosis and treatment of leukaemias, partic. acute lymphoblastic or nonlymphoblastic leukaemia Example 5; Fig 22; 20%pp; English.

A phage clone, mg11.1, which spans the breakpoint cluster region in the ALL-1 gene has been sequenced (075209). Eight Alu repeat sequences were identified and classified based on criteria published in Milosavijevic et al. (J.Mol.Evol. 32, 105-121, 1991). The high concentration of Alu sequences within the area spanned by sequence identity to genomic sequences found in 5' regulatory regions, 3'segments, or in introns of several genes such as ApoA4, Factor VIIIc subunit and G6PD' /number= 9 6935. .7966 /note= "nucleotides 7429-7559 show about 80% (Class Sb0) "Alu repeat-e (Class Sb0)" /rpt\_type= OTHER /note= "Alu repeat-h (Class Sx)" 7967. 8062 /\*tag= s /note= "Alu repeat-b (Class Sx)" 1432. .1716 /rpt\_type= OTHER /note= "Alu repeat-g (Class S)" 6788. .6934 "Alu repeat-d (Class J)" 5 /rpt\_type= orHER /note= "Alu repeat-f (06072. .6362 /\*tag= 0 "Alu repeat-c

exons 6 and 7 suggested a possible role for Alu in the chromosomal translocations involving the ALL-1 gene. Homologous recombination is not involved so the Alu repeats may act indirectly by destabilising the region.

Sequence 8342 BP: 2604 A; 1613 C; 1758 G; 2367 T;

The present sequence encodes human STCP-1. STCP-1 polypeptides
C demonstrate chemokine activity for T-cells. The polypeptides are useful
C demonstrate chemokine activity for T-cells. The polypeptides are useful
C prophylactically or therapeutically to treat HIV infection and other
C conditions associated with viral/Dacterial pathogens infecting T-cells,
C conditions associated with viral/Dacterial pathogens infecting T-cells,
C conditions associated with viral/Dacterial pathogens infecting T-cells,
C carrier and optionally modified) with a pharmaceutically acceptable
C carrier and optionally other pharmaceuticals (e.g. AZT, antibiotics etc.)
In therapeutic compositions for treating these conditions. STCP-1 also
C useful to assay for inhibitory compounds used to reduce circulatory
C system STCP-1 levels to alleviate e.g. joint inflammation associated
With rheumatoid arthritis, lupus or other autoimmune diseases. The
C polypeptides are also useful to prepare antibodies or hybridomas. The
C STCP-1 DNAA/RNA in mammalian samples.

This is a 'working draft' sequence. It currently

its of 41 contigs. The true order of the pleces

is nown and their order in this sequence record is

ary. Gaps between the contigs are represented as

of N, but the exact sizes of the gaps are unknown.

ecord will be updated with the finished sequence

n as it is available and the accession number will

Biology and Biotechnology Research Program
Lawrence Livermore National Laboratory
7000 East Avenue
Livermore, A 94550 USA
constructed at LLNL from flow-sorted chromosomes
from hybrid 5HL2-B, which carries chromosome 19 as its only human
Submitted (10-DEC-1996) J.E. Lamerdin, Human Genome Center,

Submitted (13-JUL-1998) E-mail enquires: humquery@sanger.ac.uk clonerequest'Esanger.ac.uk clone request'Esanger.ac.uk clone requests: clonerequest'Esanger.ac.uk clone requests: clonerequest'Esanger.ac.uk clone requests: clonerequest'Esanger.ac.uk clonered sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence is the entire insert of clone 78F24. The true right end of clone 430NB is at 7232 in this sequence. The true right end of clone 934P1 is at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HS78F24 145414 bp DNA PRI 21-JUL-1998 Homo sapiens DNA sequence from clone 78F24 on chromosome 22q12.1-12.3. Contains one exon of an Oxysterol-binding protein (OSBP) LIKE gene. Contains GSSs and an STS, complete sequence. ALO22336

repeat_region
85040 in this sequence. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure' feature key.

This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22, https://www.sanger.ac.uk/HGP/Chr22

Http://www.sanger.ac.uk/HGP/Chr22

T8F24 is from the library RCII constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpac.med.buffalo.edu/ VECTOR: pCYPAC2.

Direct Submission

Submitted (09-JUN-1999) Sanger Centre, Hinxton, Cambridgeshire,
CBIO 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone
requests: clonerequest@sanger.ac.uk
On May 28, 1999 this sequence version replaced gi:4902621.
During sequence assembly data is compared from overlapping clones
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em: EMBL: Sw: MYISSPROT: Tr:, TREMBL.
This sequence is the entire insert of clone 216510. The true left
end of clone 10966 is at 1 in this sequence. The start of this
sequence overlaps with the end of sequence AD021453.
The end of this sequence overlaps with the start of sequence
The end of this sequence overlaps with the start of sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence has been finished according to sequence.map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence was generated from part of bacterial clone contigs whan chromosome 22, constructed by the Sanger Centre Chromosome Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr22 16E10 is from the human BAC library described in U-J. Kim et al. (1996) Genomics 34, 213-218. VECTOR: pBAC108L.                                                  NOTE: This is a 'working draft' sequence. It currently consists of 21 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Submitted (07-DEC-1998) Sanger Centre, Hinxton, Cambridgeshire, Caudalitted (17-DEC-1998) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Dec 8, 1998 this sequence version replaced gi:1772964.
Ouring sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

IMPORTANT: This sequence is not the entire insert of clone 426N21. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The true right end of clone dJ537K23 is at 100 in this sequence.
This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HS426N21 44826 bp DNA PRI 08-DEC-1998
Human DNA sequence from clone 426N21 on chromosome X Contains EST,
STS, GSS, complete sequence.
